

Acknowledgements

I would like to thank dr. A.C.M. Rietveld of the Catholic University of Nijmegen, the Netherlands for performing the sentence-accent labelling of the speech material used in this study and D.R. van Bergem of the University of Amsterdam for providing the method for measuring vowel formant values at near stationary positions of the realizations. The text used was selected by dr. W. Eefting of the State University of Utrecht, and the speech was recorded by her and dr. J. Terken of the Institute of Perception Research, Eindhoven. This research project was part of the Dutch national program *Analysis and synthesis of speech* funded by the Dutch program for the Advancement of Information Technology (SPIN).
